1,4,5-TRIPHENYL PYRAZOLYL COMPOUNDS FOR THE  
TREATMENT OF INFLAMMATION AND INFLAMMATION-RELATED  
DISORDERS

5

FIELD OF THE INVENTION

This invention is in the field of anti-inflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated disorders, such as arthritis.

BACKGROUND OF THE INVENTION

15

Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of PGG<sub>2</sub>, PGH<sub>2</sub> and PGE<sub>2</sub>, has been a common target of anti-inflammatory drug discovery. However, common non-steroidal anti-inflammatory drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. A popular current alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

Several families of pyrazole-containing compounds have been described as having anti-inflammatory activity. U.S. Patent No. 5,134,142 to Matsuo et al describes 1,5-diaryl-pyrazoles, and specifically 1-(4-fluorophenyl)-5-[(4-methylsulfonyl)phenyl]-3-trifluoromethyl-1H-pyrazole, as having anti-inflammatory activity.

U.S. Patent No. 3,984,431 to Gueremy et al describes derivatives of pyrazole-5-acetic acid as having anti-inflammatory action. Isofezolac (1,3,4-triphenyl-1H-pyrazole-5-acetic acid) is specifically described. 1,3,4-Triphenyl-5-(chloromethyl)-1H-pyrazole is described as an intermediate in the formation of the above mentioned derivatives. Isofezolac has been found to be as ulcerogenic as other common anti-inflammatory agents [J. Mizoule et al, Arch. int. Pharmacodyn., 238, 305 (1979)].

Little pharmaceutical activity has been described for 1,4,5-triphenyl-1H-pyrazolyl compounds. The rearrangement of epoxyketones has been observed to produce 1,4,5-triphenyl-1H-pyrazole [H. House et al, J. Amer. Chem. Soc., 79, 2490 (1957)]. Photochemical reactions of 4-(2-chlorophenyl)-1,5-diphenyl-1H-pyrazole and of 1,4,5-triphenyl-1H-pyrazole have been described [J. Grimshaw et al, J. Chem. Soc. Perkin. Trans. 1, 2096 (1977)]. The synthesis of a series of 1-aryl-4,5-diphenyl-1H-pyrazoles and a series of 1-aryl-3,4-diphenyl-1H-pyrazoles by reacting 2-phenylacrylophenone and arylhydrazines has been described [J. Wilshire, Aust. J. Chem., 27, 2041 (1974)]. Specifically 1-(4-methylphenyl)-4,5-diphenyl-1H-pyrazole is described. The rearrangement of epoxyphenylpropiophenone has been observed to produce 1-phenyl-4,5-substitutedphenyl-1H-pyrazoles, and specifically 1-phenyl-4,5-di(chlorophenyl)-1H-pyrazole [H. House et al, J. Amer. Chem. Soc., 83, 979 (1961)]. Triarylpyrazole compounds are prepared by reacting thioketoaldehydes and phenylhydrazines [M. Weissenfels et al, J. Prakt. Chem., 315, 873 (1973)] and specifically 4,5-bis(4-methoxyphenyl)-1-phenyl-1H-pyrazole. The reaction of phenylhydrazines with isoflavonoids to yield pyrazole compounds, such as 2-(1,4-diphenyl-1H-pyrazol-5-yl)-phenol has been described [V. Szabó et al, Acta Chim. Acad. Sci. Hung., 98, 457 (1979)].

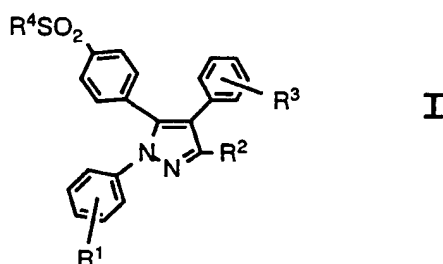

The reaction of benzoin phenylhydrazone with aldehydes to produce 3-alkyl-1,4,5-triphenyl-1H-pyrazoles is described [H. Gnichtel et al, Liebigs Ann. Chem., 589 (1989)]. Specifically, 3-methyl-1,4,5-triphenyl-1H-pyrazole is described. The reaction of dinitrophenyl diketone derivatives with hydrazines has been studied, and 4-(2,4-dinitro)phenyl-1-(4-methylphenyl)-5-phenyl-3-methyl-1H-pyrazole has been described [I. Gambhir et al, J. Org. Chem., 27, 1899 (1962)].

1,4,5-Triphenyl-3-bromomethyl-1H-pyrazole is described as an intermediate in the synthesis of 1,4,5-triphenyl-1H-pyrazole-3-ethanoic acid, which is a potential anti-inflammatory agent [H. Biere, Arch. Pharm., 316, 608 (1983)].

Where the term "alkyl" is used, either alone or within other terms such as "haloalkyl", "alkoxyalkyl" and  
10 "hydroxyalkyl", embraces linear or branched radicals having one to about twenty carbon atoms or, preferably, one to about twelve carbon atoms. More preferred alkyl radicals are "lower alkyl" radicals having one to about ten carbon atoms. Most preferred are lower alkyl  
15 radicals having one to about six carbon atoms. Examples of such radicals include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, pentyl, iso-amyl, hexyl, and the like. The term "hydrido" denotes a single hydrogen atom (H). This hydrido radical  
20 may be attached, for example, to an oxygen atom to form a hydroxyl radical or two hydrido radicals may be attached to a carbon atom to form a methylene (-CH<sub>2</sub>-) radical. The term "halo" means halogens such as fluorine, chlorine, bromine or iodine atoms. The term "haloalkyl" embraces  
25 radicals wherein any one or more of the alkyl carbon atoms is substituted with halo as defined above. Specifically embraced are monohaloalkyl, dihaloalkyl and polyhaloalkyl radicals. A monohaloalkyl radical, for example, may have either a bromo, chloro or a fluoro atom  
30 within the radical. Dihalo radicals have two halo radicals or a combination of different halo radicals and polyhaloalkyl radicals have more than two of the same halo atoms or a combination of different halo radicals. Most preferred are lower haloalkyl radicals having one to  
35 about six carbon atoms. The term "alkoxy" embraces linear or branched oxy-containing radicals each having alkyl portions of one to about ten carbon atoms. Most preferred are lower alkoxy radicals having one to about six carbon

atoms. The "alkoxy" radicals may be further substituted with one or more halo atoms, such as fluoro, chloro or bromo, to provide haloalkoxy or haloalkoxyalkyl radicals. The term "alkylthio" embraces radicals containing a linear or branched alkyl radical, of one to about ten carbon atoms attached to a divalent sulfur atom, such as a methythio radical. Most preferred are lower alkylthio radicals having one to about six carbon atoms. The term "sulfonyl", whether used alone or linked to other terms such as alkylsulfonyl, denotes respectively divalent radicals  $-SO_2-$ . "Alkylsulfonyl" embraces alkyl radicals attached to a sulfonyl radical, where alkyl is defined as above. Most preferred are lower alkylsulfonyl radicals having one to about six carbon atoms. The term "alkylsulfinyl" embraces radicals containing a linear or branched alkyl radical, of one to ten carbon atoms, attached to a divalent  $-S(=O)-$  atom. Most preferred are lower alkylsulfinyl radicals having one to about six carbon atoms. The terms "aminosulfonyl", "sulfamyl" and "sulfonamidyl" denote a sulfonyl radical substituted with an amine radical, forming a sulfonamide ( $-SO_2NH_2$ ). The terms "N-alkylamino" and "N,N-dialkylamino" denote amino groups which have been substituted with one alkyl radical and with two alkyl radicals, respectively. Most preferred are lower alkylamino and dialkylamino radicals having alkyl radicals of one to about six carbon atoms. The term "acyl", whether used alone, or within a term such as "acylamino", denotes a radical provided by the residue after removal of hydroxyl from an organic acid. The term "acylamino" embraces an amino radical substituted with an acyl group. An examples of an "acylamino" radical is acetyl amino ( $CH_3C(=O)-NH-$ ). The term "acylaminoalkyl" embraces an alkyl radical substituted with an acylamino group, as defined above. An example of an "acylaminoalkyl" radical is (acetyl amino)methyl ( $CH_3C(=O)NHCH_2-$ ).

#### GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized according to the following procedures of Schemes I-III, wherein the R<sup>1</sup>-R<sup>4</sup> substituents are as defined for Formula I, above, except where further noted.

32

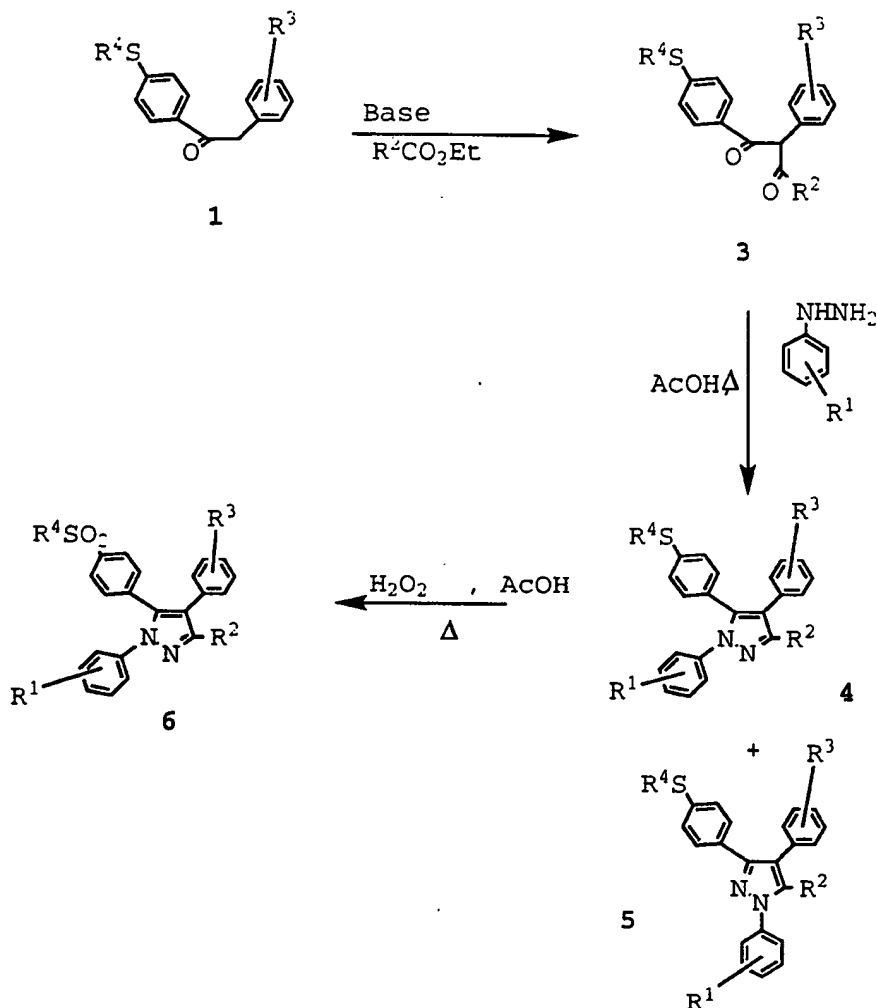

## Scheme I

In step 1 of synthetic Scheme I, 1-[(4-alkylthio)phenyl]-2-[R<sup>3</sup>-phenyl]ethanone 1 is reacted with sodium hydride in an anhydrous aprotic solvent, such as dimethylformamide or tetrahydrofuran to form the sodium enolate. Reaction of the enolate with gaseous haloalkylnitrile yields the enamine 2. In step 2, the enamine 2 is hydrolyzed with 6N hydrochloric acid to give the 1,3-diketone 3. In step 3, reaction of the diketone 3 with a substituted or unsubstituted phenylhydrazine gives the 5-[4-(alkylthio)phenylpyrazole] 4 and its position isomer 5. Separation of the desired product from its isomer can be achieved by high performance liquid chromatography (HPLC). In step 4, oxidation of pyrazole 4 with hydrogen

peroxide yields 5[4-(alkylsulfonyl)phenyl]-1*H*-pyrazole compounds 6 embraced by Formula I.

Scheme II

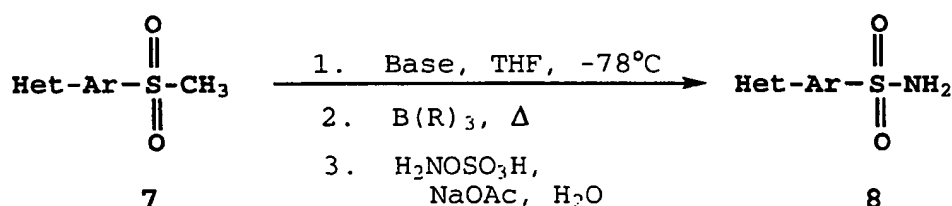

Alternatively, the compounds embraced by Formula I may be prepared, as shown in Scheme II. In step 1, 1-[(4-alkylthio)phenyl]-2-[R<sup>3</sup>-phenyl]ethanone 1 is reacted with strong base, such as sodium methoxide, lithium diisopropylamide (LDA), lithium 2,2,6,6-tetramethylpiperidide or sodium bis(trimethylsilyl)amide, and an ester or ester equivalent, such as an acyl imidazole, under Claisen condensation conditions, to give the 1,3-diketone 3. In step 2, reaction of the diketone 3 with a substituted or

unsubstituted phenylhydrazine gives the (5-[4-alkylthio)phenyl]-1H-pyrazole 4 and its position isomer 5. Separation of the desired product from its isomer can be achieved by high performance liquid chromatography (HPLC). In step 4, oxidation of pyrazole 4 with hydrogen peroxide yields 5-[4-(alkylsulfonyl)phenyl]-1-H-pyrazole compounds 6 embraced by Formula I.

### Scheme III

10

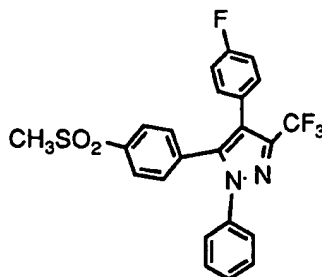

Synthetic Scheme III shows the three step procedure used to prepare sulfonamide antiinflammatory agents 8 from their corresponding methyl sulfones 7. In step one, THF solutions of the methyl sulfones 7 at  $-78^\circ\text{C}$  are treated with an alkylolithium reagent, e.g., methyllithium, n-butyllithium, etc. In step two, the anions generated in step one are treated with an organoborane, e.g., triethylborane, tributylborane, etc., at  $-78^\circ\text{C}$  then allowed to warm to ambient temperature prior to stirring at reflux. In step three, an aqueous solution of sodium acetate and hydroxylamine-O-sulfonic acid is added to provide the corresponding sulfonamide antiinflammatory agents 8 of this invention.

The following examples contain detailed descriptions of the methods of preparation of compounds of Formula I. These detailed descriptions fall within the scope, and serve to exemplify, the above described General Synthetic Procedures which form part of the invention. These detailed descriptions are presented for

illustrative purposes only and are not intended as a restriction on the scope of the invention. All parts are by weight and temperatures are in Degrees centigrade unless otherwise indicated.

### EXAMPLE 1

10

4-(4-Fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-  
1-phenyl-3-(trifluoromethyl)pyrazole.

15 Step 1: Preparation of 3-amino-4,4,4-trifluoro-2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]-2-buten-1-one

To a mixture of 2.6 g (0.087 mol) of 80% sodium hydride oil dispersion and 10 mL of dimethylformamide (DMF) was added, under nitrogen, a solution of 21.4 g (0.082 mol) of 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]ethanone in 150 mL of DMF for 30 minutes. The resulting mixture was stirred at room temperature for 1 hour. To the above mixture was passed 10 g (0.11 mol) of gaseous trifluoroacetonitrile for 40 minutes. The reaction mixture was analyzed by TLC. The reaction mixture was poured into 400 mL of water and the solid precipitate was filtered and air dried. The solid precipitate was stirred with 300 mL of ether. The insoluble material was filtered to give 6.0 g (28%) of unreacted 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]ethanone. The ether filtrate was dried over  $\text{MgSO}_4$  and concentrated in vacuo. The ether filtrate was recrystallized from 5% ethyl acetate-hexane

to give 12.3 g of a mixture (6:1) of 3-amino-4,4,4-trifluoro-2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]-2-buten-1-one and 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]ethanone. This solid was heated with 100 mL of ether and cooled. The insoluble solid of 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]ethanone (0.5 g) was filtered. The ether filtrate was concentrated and the residue was recrystallized from 10% ethyl acetate-hexane to give 10.5 g (36%) of 3-amino-4,4,4-trifluoro-2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]-2-buten-1-one, mp 122.5-124.5 °C. The combined ethyl acetate-hexane mother liquor was concentrated and the residue was purified by HPLC (10% ethyl acetate-hexane). The second fraction gave an additional 2.6 g (9%) of 3-amino-4,4,4-trifluoro-2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]-2-buten-1-one after recrystallization from 5% ethyl acetate-hexane.

Step 2: Preparation of 4-(4-fluorophenyl)-3-[4-(methylthio)phenyl]-1-phenyl-5-(trifluoromethyl)pyrazole and 4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-1-phenyl-3-(trifluoromethyl)pyrazole.

A mixture of 4.0 g of product of step 1, 40 mL of ether, and 40 mL of 6 N hydrochloric acid was stirred at room temperature for 4 days. The ether layer was dried over magnesium sulfate and concentrated in vacuo to give 4.0 g of crude 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl]-4,4,4-trifluoro-1,3-butandione. A mixture of 0.22 g (0.59 mmol) of this product, 0.09 g of phenylhydrazine, and 10 mL of glacial acetic acid was heated at 80 °C for 18 hours and poured into water. The insoluble solid was purified by HPLC (10% ethyl acetate-hexane) to give 8 mg of 4-(4-fluorophenyl)-3-[4-(methylthio)phenyl]-1-phenyl-5-(trifluoromethyl)pyrazole and 140 mg of 4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-1-phenyl-3-(trifluoromethyl)pyrazole.

Step 3: Preparation of 4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-1-phenyl-3-(trifluoromethyl)pyrazole.

5

To a mixture of 140 mg of 4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-1-phenyl-3-(trifluoromethyl)pyrazole and 30 mL of glacial acetic acid was added 4.1 g of 30% hydrogen peroxide. The reaction mixture was stirred at room temperature for 18 hours, heated at 80 °C for 8 hours, and poured into water. The insoluble solid was filtered and air dried to give 150 mg of solid, mp 201.5-203 °C.

**BIOLOGICAL EVALUATION**

Rat Carrageenan Foot Pad Edema Test

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as described by Winter, et al., (Proc. Soc. Exp. Biol. Med., 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and .025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, Laboratory

Models for Testing NSAIDs. in Non-steroidal Anti-Inflammatory Drugs, (J. Lombardino, ed. 1985)). Results are shown in Table I.
